

Training Day – 7

Today's training focused on exploring the **AWS Management Console** and understanding the global infrastructure used by AWS to provide cloud services. The session provided practical exposure to the AWS interface, Regions, Availability Zones, and Local Zones.

Work Undertaken:

- Explored the **AWS Management Console** and became familiar with its user interface and navigation.
- Identified the currently selected **AWS Region** and understood the importance of choosing an appropriate geographical region when working with cloud resources.
- Explored various **AWS services** available through the Management Console and gained an initial understanding of how these services are organized.
- Studied the **AWS Global Infrastructure** and located different AWS Regions across various geographical locations.
- Examined the **Availability Zones** within the selected AWS Region and understood their role in providing reliable and highly available cloud infrastructure.
- Identified a **Local Zone** and its corresponding code to understand how AWS extends infrastructure closer to end users and specific locations.

Additional Learning:

The session helped me understand how AWS organizes its infrastructure geographically. Learning about Regions, Availability Zones, and Local Zones provided a clearer understanding of how cloud resources can be distributed to improve availability, reliability, and performance.

Conclusion:

The day provided practical familiarity with the AWS Management Console and introduced the structure of AWS Global Infrastructure. Understanding Regions, Availability Zones, and Local Zones established an important foundation for working with AWS services and deploying applications in cloud environments.
