

Training Day – 8

Today's training focused on gaining practical experience with **Amazon EC2** and deploying a basic web server on a cloud-based Linux instance. The session covered EC2 instance creation, secure SSH access, file transfer, Nginx configuration, and basic AWS cost monitoring.

Work Undertaken:

- Created and configured an **AWS account** to access and work with cloud services.
- Explored **Amazon EC2 (Elastic Compute Cloud)** and understood its purpose for launching and managing virtual servers in the cloud.
- Successfully created an EC2 instance by completing the complete launch process:
- Explored the **AWS Billing and Cost Management** dashboard to understand cloud usage, billing information, and cost monitoring.
- Learned different methods for connecting to a Linux EC2 instance:
- Successfully established an **SSH connection** to the Ubuntu EC2 instance.
- Learned how to transfer files between the cloud server and local machine using **SCP (Secure Copy Protocol)**.
- Installed the **Nginx web server** on the Ubuntu EC2 instance using Linux command-line commands.
- Started and verified the Nginx service to ensure that the web server was running correctly.
- Created and hosted a sample webpage by modifying the default Nginx file located at `/var/www/html/index.html`.
- Verified the deployment by accessing the EC2 instance through its **public IP address** in a web browser.

Additional Learning:

The practical work provided experience with the complete process of deploying a basic web server on a cloud-based Linux machine. It also strengthened my understanding of SSH authentication, public IP addressing, secure file transfer, Linux server administration, and cloud resource management.

Conclusion:

The day provided valuable hands-on experience with **AWS EC2 and Linux server management**. Successfully launching an Ubuntu instance, connecting through SSH, installing Nginx, and hosting a webpage demonstrated the basic workflow involved in deploying web applications on cloud infrastructure.
